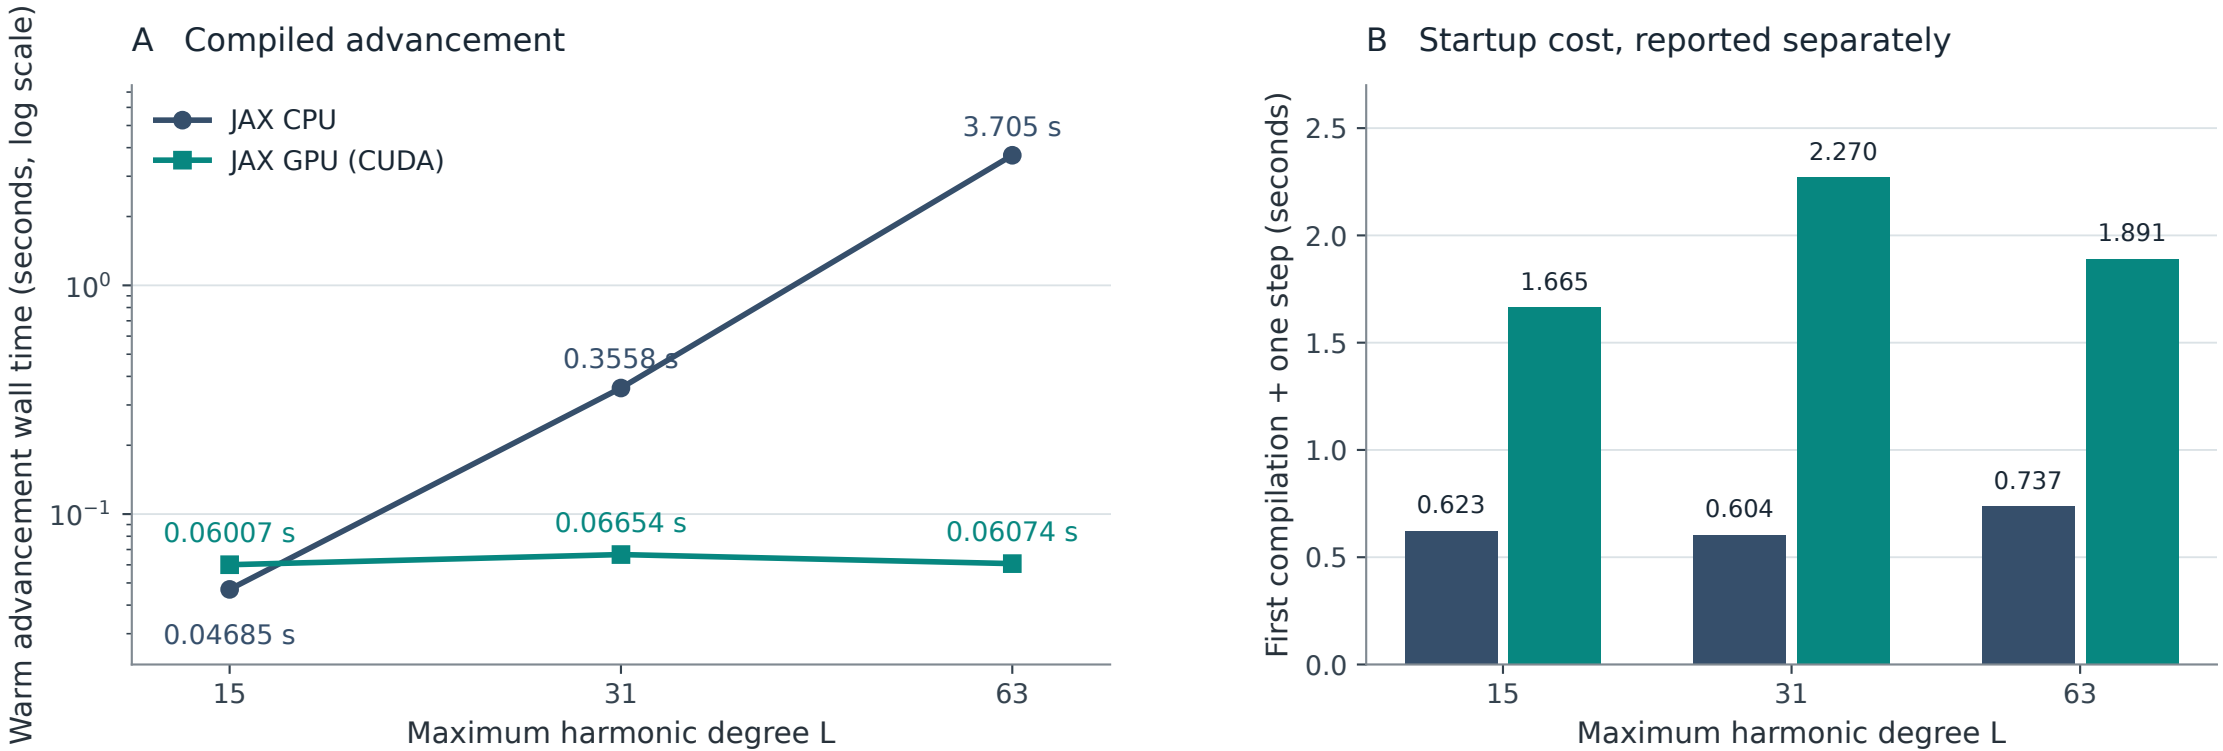
Independent spectral solver · Unity benchmark

100 steps × 0.001 · Ω = 2 · inviscid · float64 / complex128



Separate CPU and GPU allocations; A100 requested, CUDA execution recorded. Hardware model strings were not logged.

Warm timing excludes compilation and transfer/output. One observation per case; this is not a Fortran performance comparison.

17 validation tests passed on each backend. Maximum GPU / NumPy relative coefficient difference: 2.8×10^{-15}.
